Overview

Objective:

Describe the implementation of a treatment plan

Components:

- * Reviewing the treatment plan
- Treatment delivery
- Patient Education

Reviewing the Treatment Plan

- The Nurse Case Manager ensures the development of a patient-centered treatment plan that is reviewed by the Nurse, Patient, and Healthcare worker
- Encourage patient involvement in their own treatment
- The final treatment plan should be discussed and validated with all team members and the patient

Treatment Delivery

- Anti-tuberculosis treatment delivery is carried out through directly observed therapy (DOT)
- DOT is widely used as the standard of practice

Directly Observed Therapy (DOT)

- The practice of having a health care worker or other trained individual observe the patient swallow each dose of the prescribed TB medications
- Most effective strategy for ensuring patient adherence to treatment (CDC, 2017a)
- Allows for the counting of the exact number of medication doses taken and ensures the required number of doses are completed within the recommended time
- Allows for the early recognition of adverse drug events by performing toxicity and symptoms screenings

Clinic

- Patient's home
- Place of employment
- School

Electronic DOT, (eDOT)

Any place that is mutually agreeable and safe

Self-Administered Therapy

- Not recommended for patients with TB disease
- When is it used:
 - Weekends
 - Holidays
 - Traveling

Doses should <u>NOT</u> be counted toward the required number of doses needed for treatment completion

Continued Monitoring

- Ensure proper documentation of toxicities through the use of screening forms
- Ask the patient how are they doing at every visit *
- Pill counts (have patient bring medication bottles back during monthly visits)
- Clinical outcomes (weight gain, decrease s/s, bacteriology, CXR, serum drug levels

Patient Education

- Acknowledge and address the patient's perceptions and concerns about their TB diagnosis and treatment
- Ensure patient communicates regularly about any changes with TB treatment or other comorbidities they are concurrently being treated for
- Review the treatment plan regularly and make adjustments as needed

Summary

- Implementation includes reviewing the treatment plan with the nurse, patient, and healthcare worker
- Treatment delivery is achieved through DOT in a mutually agreeable and safe place and more recently also through electronic DOT through video graphic devices. DOT is the most effective form of TB treatment. Self Administered therapy is not recommended.
- Patient education should be performed throughout the course of treatment always.

Thank you!
