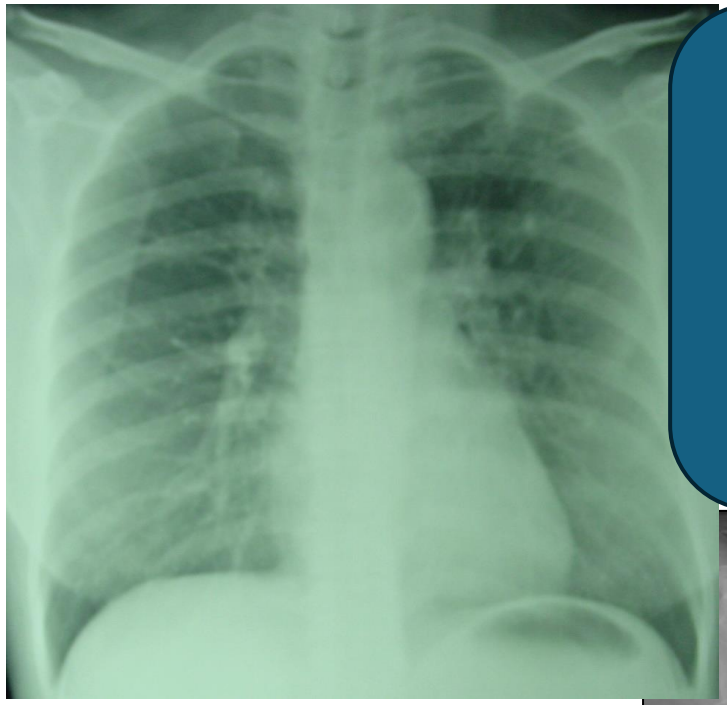
One Size Does *Not* Fit All

Barbara J. Seaworth, MD

Co-Medical Director

Heartland National TB Center

One size for everyone?

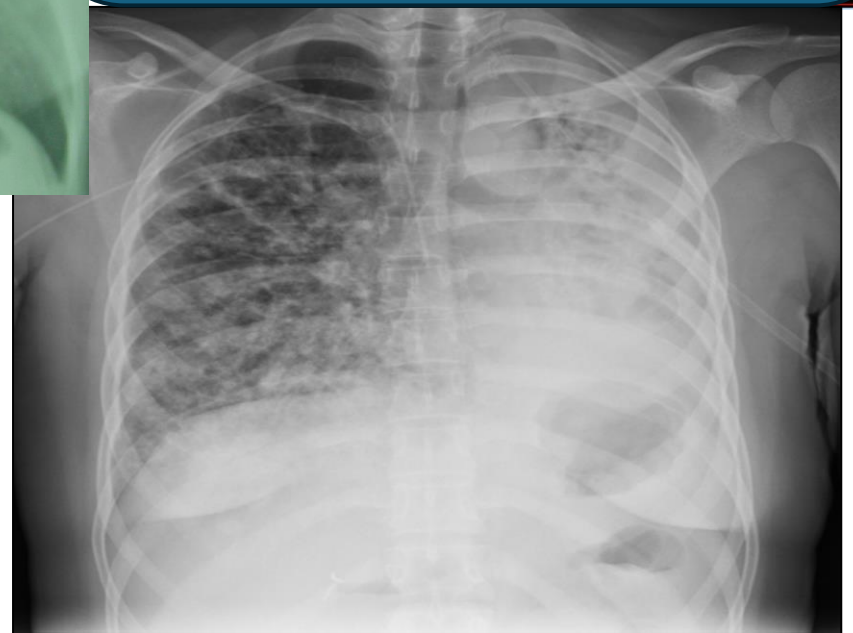


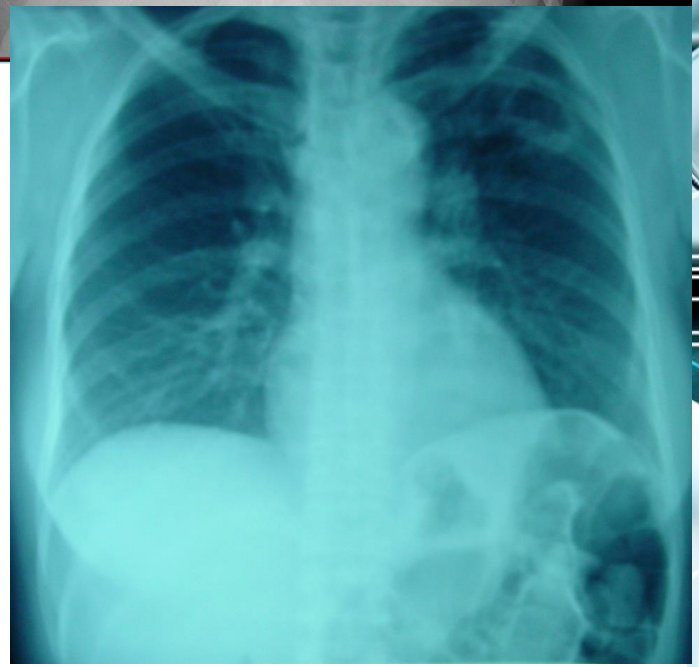
Standard duration:

6 months RIPE (Drug Sen TB)

6 months RPE + moxi (INH R)

6 months BPAL (MDR TB)
6 months BPALM (MDR TB)





One Size for everyone…

- Current TB Guidelines suggest **Standard dose:**
  - Rifampin/rifabutin/rifapentine
  - INH
  - Bedaquiline
  - Pretomanid
  - Linezolid
  - Moxifloxacin

How can we give each person what they really need?

Optimized dosing

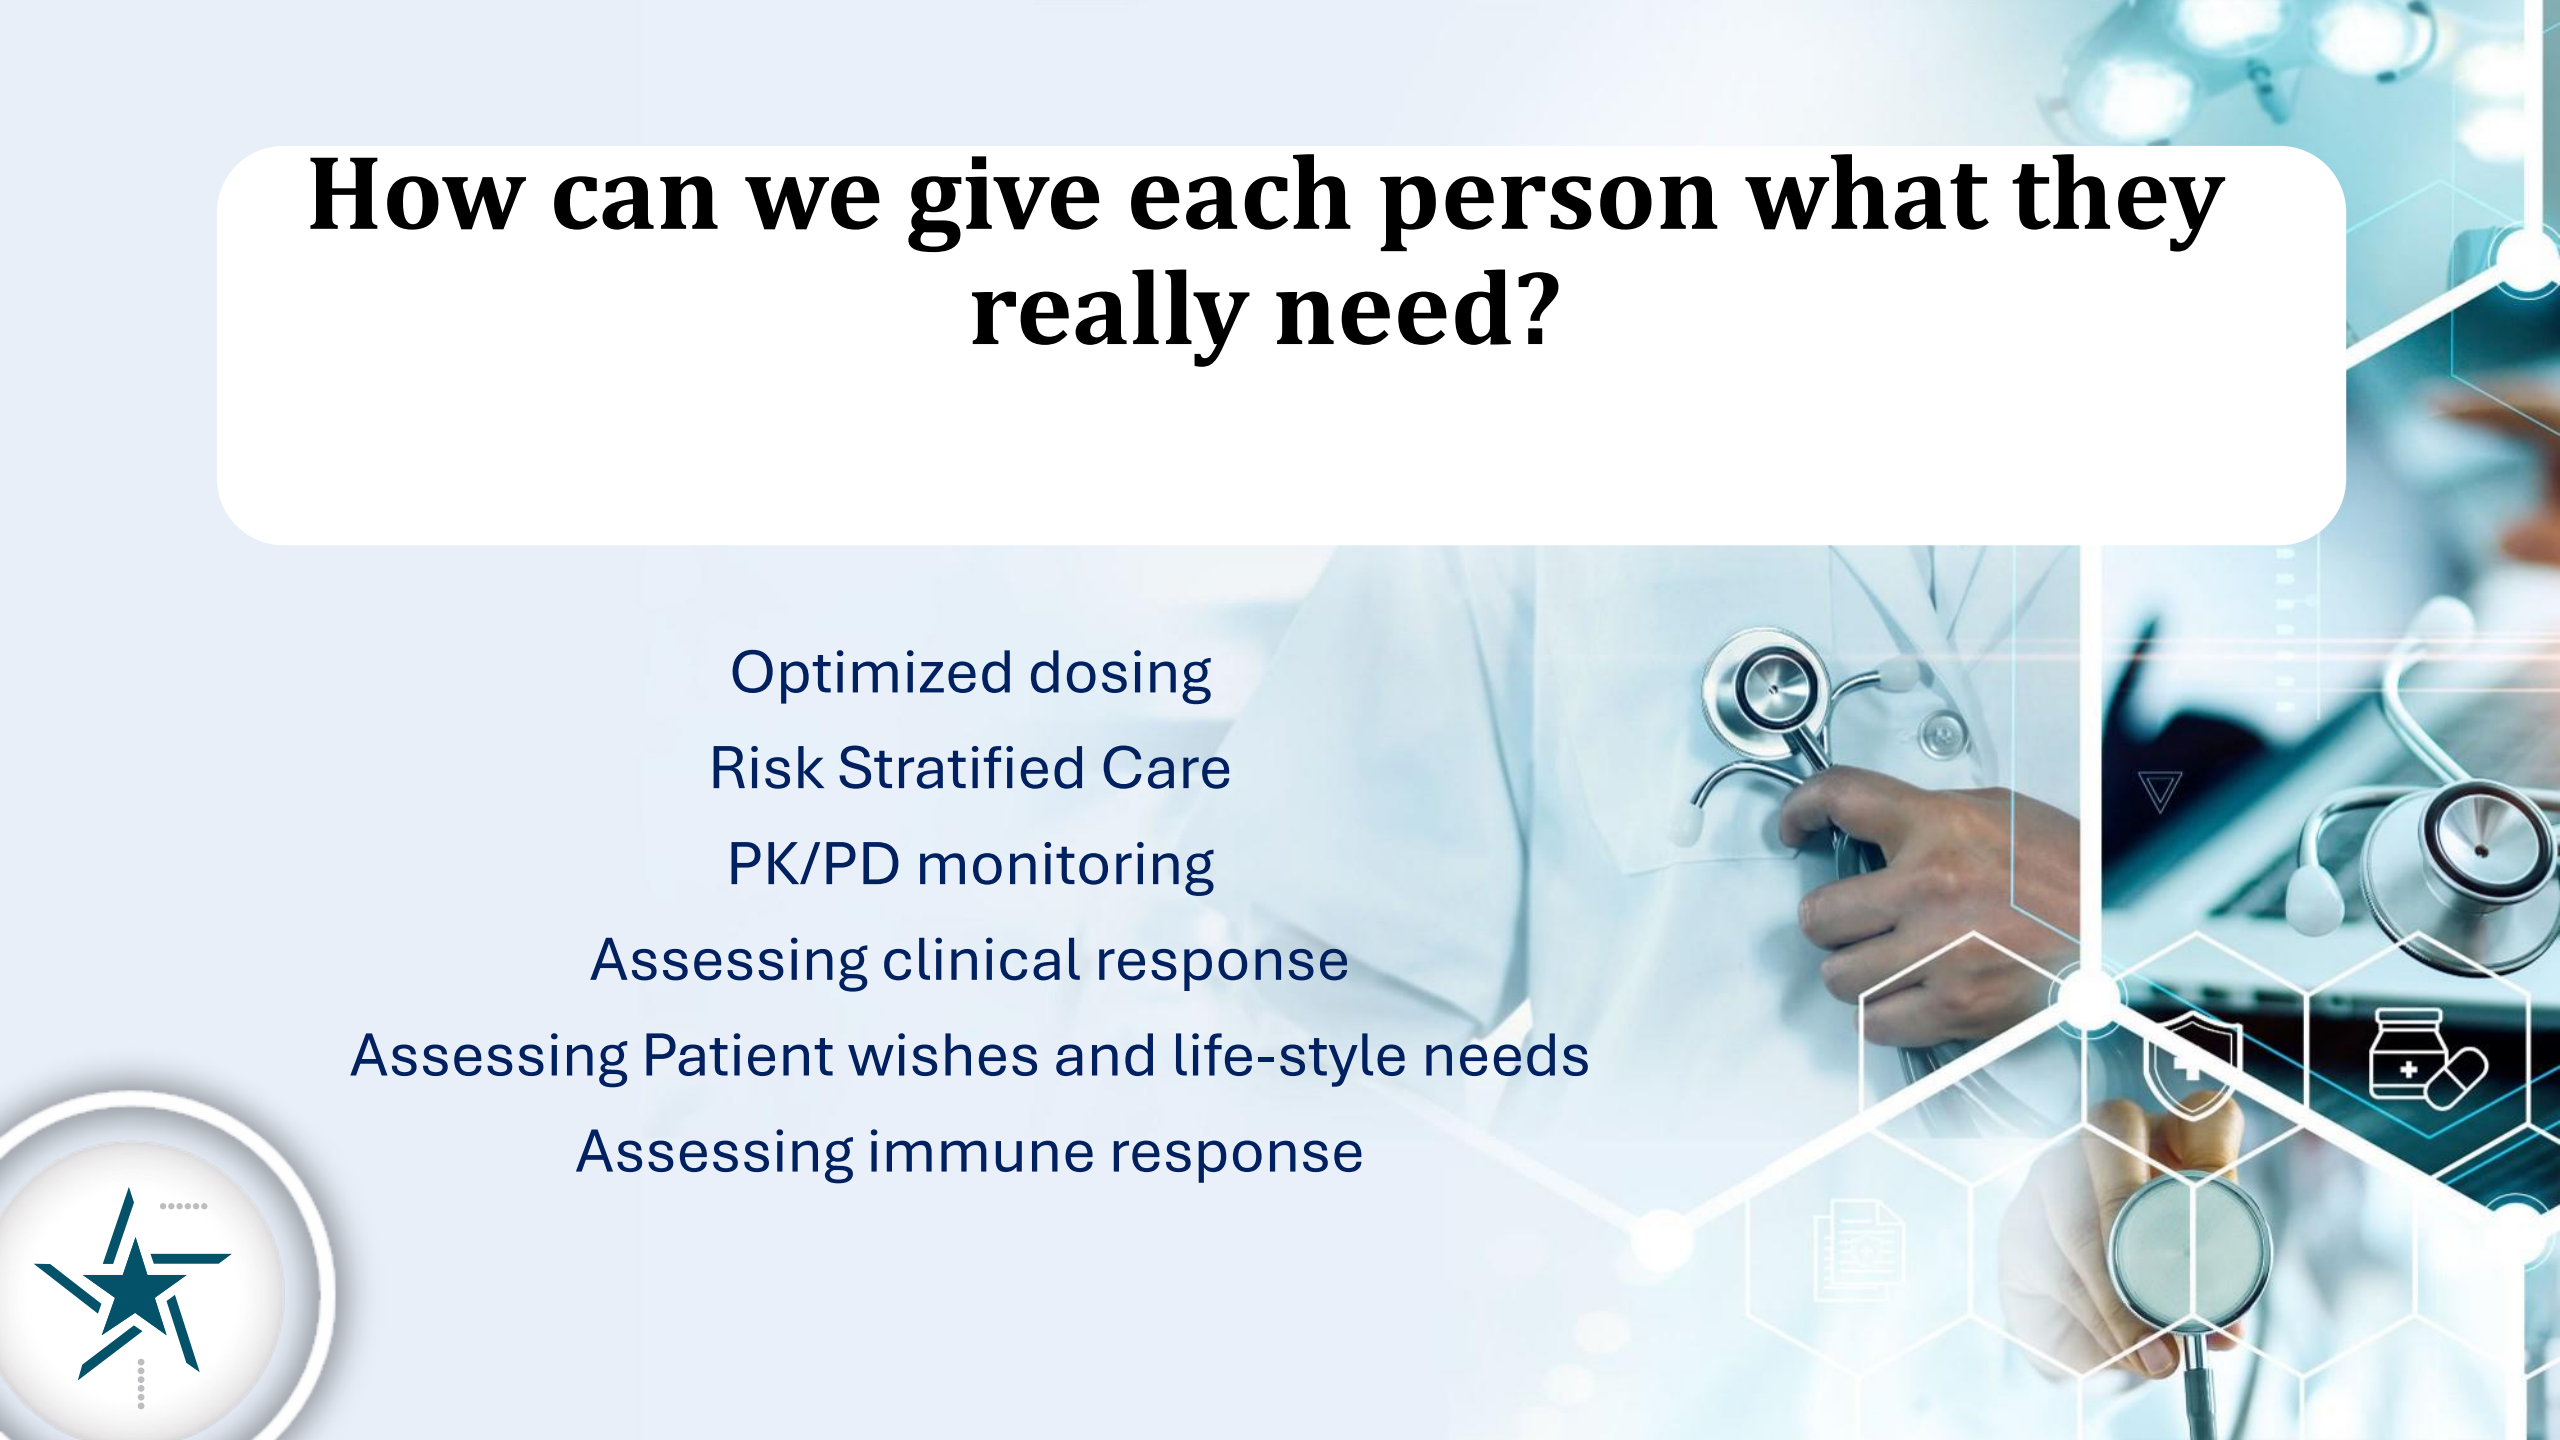
Risk Stratified Care

PK/PD monitoring

Assessing clinical response

Assessing Patient wishes and life-style needs

Assessing immune response



Where we are with attempting to individualize care?

- Nurse Case Management – VDOT – patient-based therapy
- Assessment of co-morbid conditions, medications, lifestyle
- Informal provider-based assessment of extent of disease
- Serum Drug level monitoring
- Assessment of treatment response for treatment duration
  - Clinical
  - Bacteriological
  - Radiographic

Treatment Shortening: Drug Susceptible TB Disease

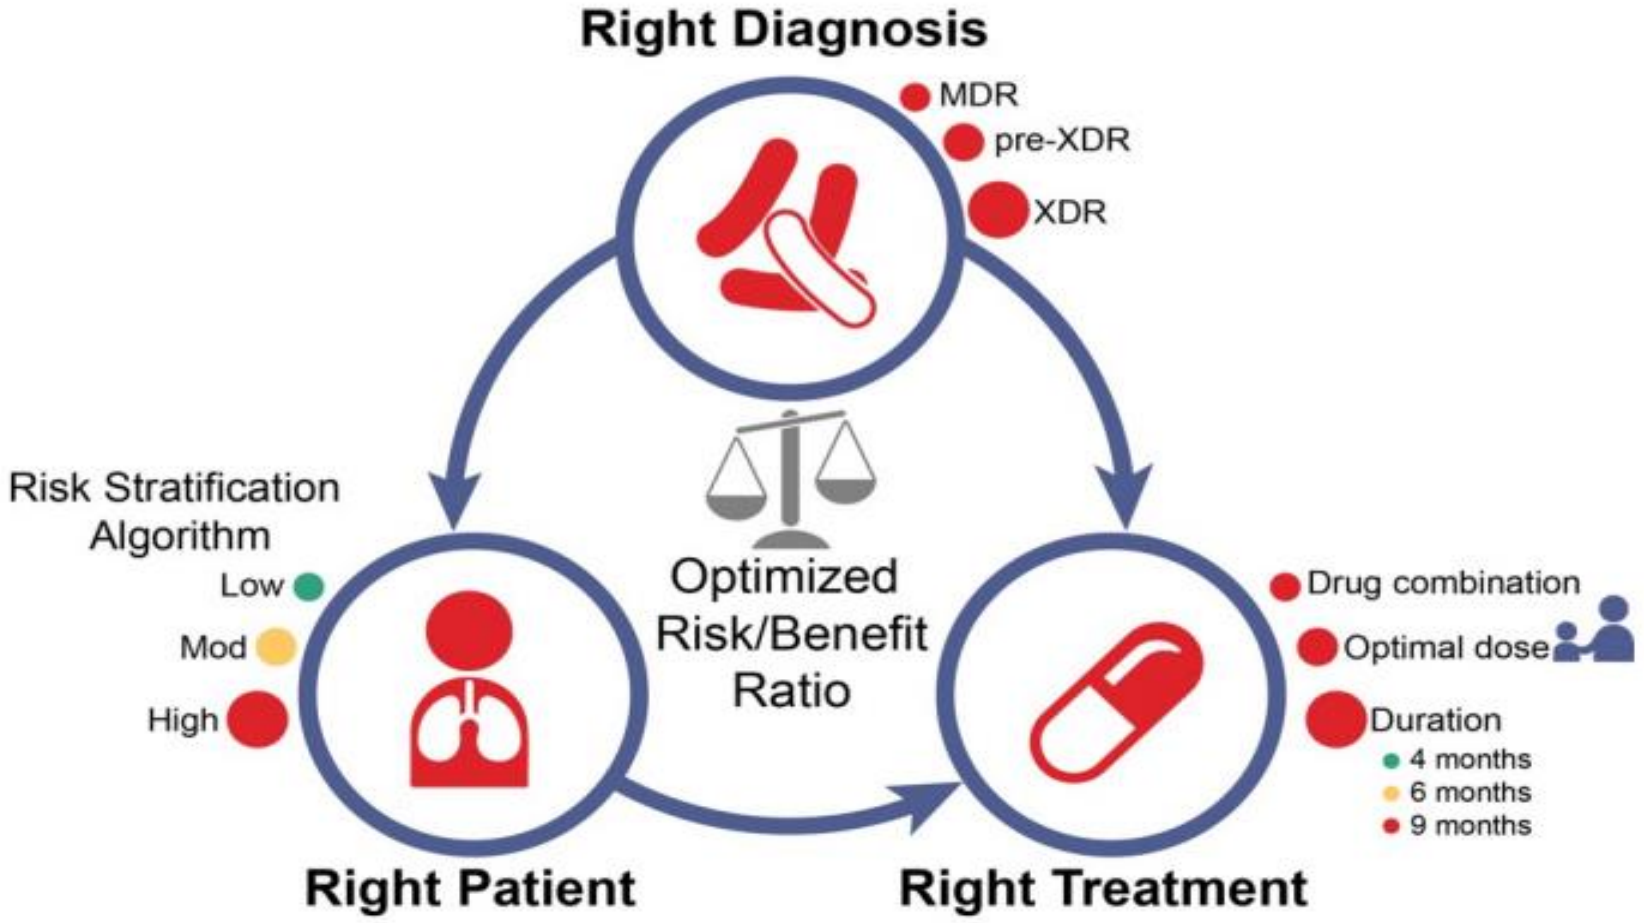
- **TB Trial Consortium Study 31**
  - 4 months of Rifapentine, INH, Moxifloxacin, PZA
- **Shine Trial**
  - 4 months for drug susceptible, limited disease in children
  - RIPE x 2; RI x 2

Treatment Shortening: MDR or RR TB

- **BDQ, Pretomanid, Linezolid plus moxifloxacin (BPALM) x 6 months**
- **BDQ, Pretomanid, Linezolid (BPAL) x 6 months**

Stratified Care – Precision Medicine

Giving each patient what they need



With gratitude to Dr. Rada Savic for sharing her work a number of subsequent slides are hers or from her publications.

Precision-Enhancing Risk Stratification Tools for Selecting Optimal Treatment Durations in Tuberculosis Clinical Trials

Marjorie Z. Imperial[1,2], Patrick P. J. Phillips[2,3], Payam Nahid[2,3], and Radojka M. Savic[1,2,3]

[1]Department of Bioengineering and Therapeutic Sciences; [2]University of California, San Francisco, Center for Tuberculosis, and [3]Division of Pulmonary and Critical Care Medicine, San Francisco General Hospital, University of California, San Francisco, San Francisco, California

ORCID IDs: 0000-0001-7434-3012 (M.Z.I.); 0000-0002-6336-7024 (P. P.J.P.); 0000-0003-2811-1311 (P.N.); 0000-0003-3143-5579 (R.M.S.).

Six item risk score successfully grouped participants into **low, moderate and high-risk** requiring treatment durations of 4, 6 and greater than 6 months to reach a target cure of 93% when receiving standard dose rifamycin containing regimens

With current “one –duration-fits-all approaches:
High risk groups have a 3.7-fold and a 4-fold higher hazard risk of unfavorable outcomes compared with low and moderate risk groups.

Four-month regimens were noninferior to the standard 6-month regimen in the low-risk group

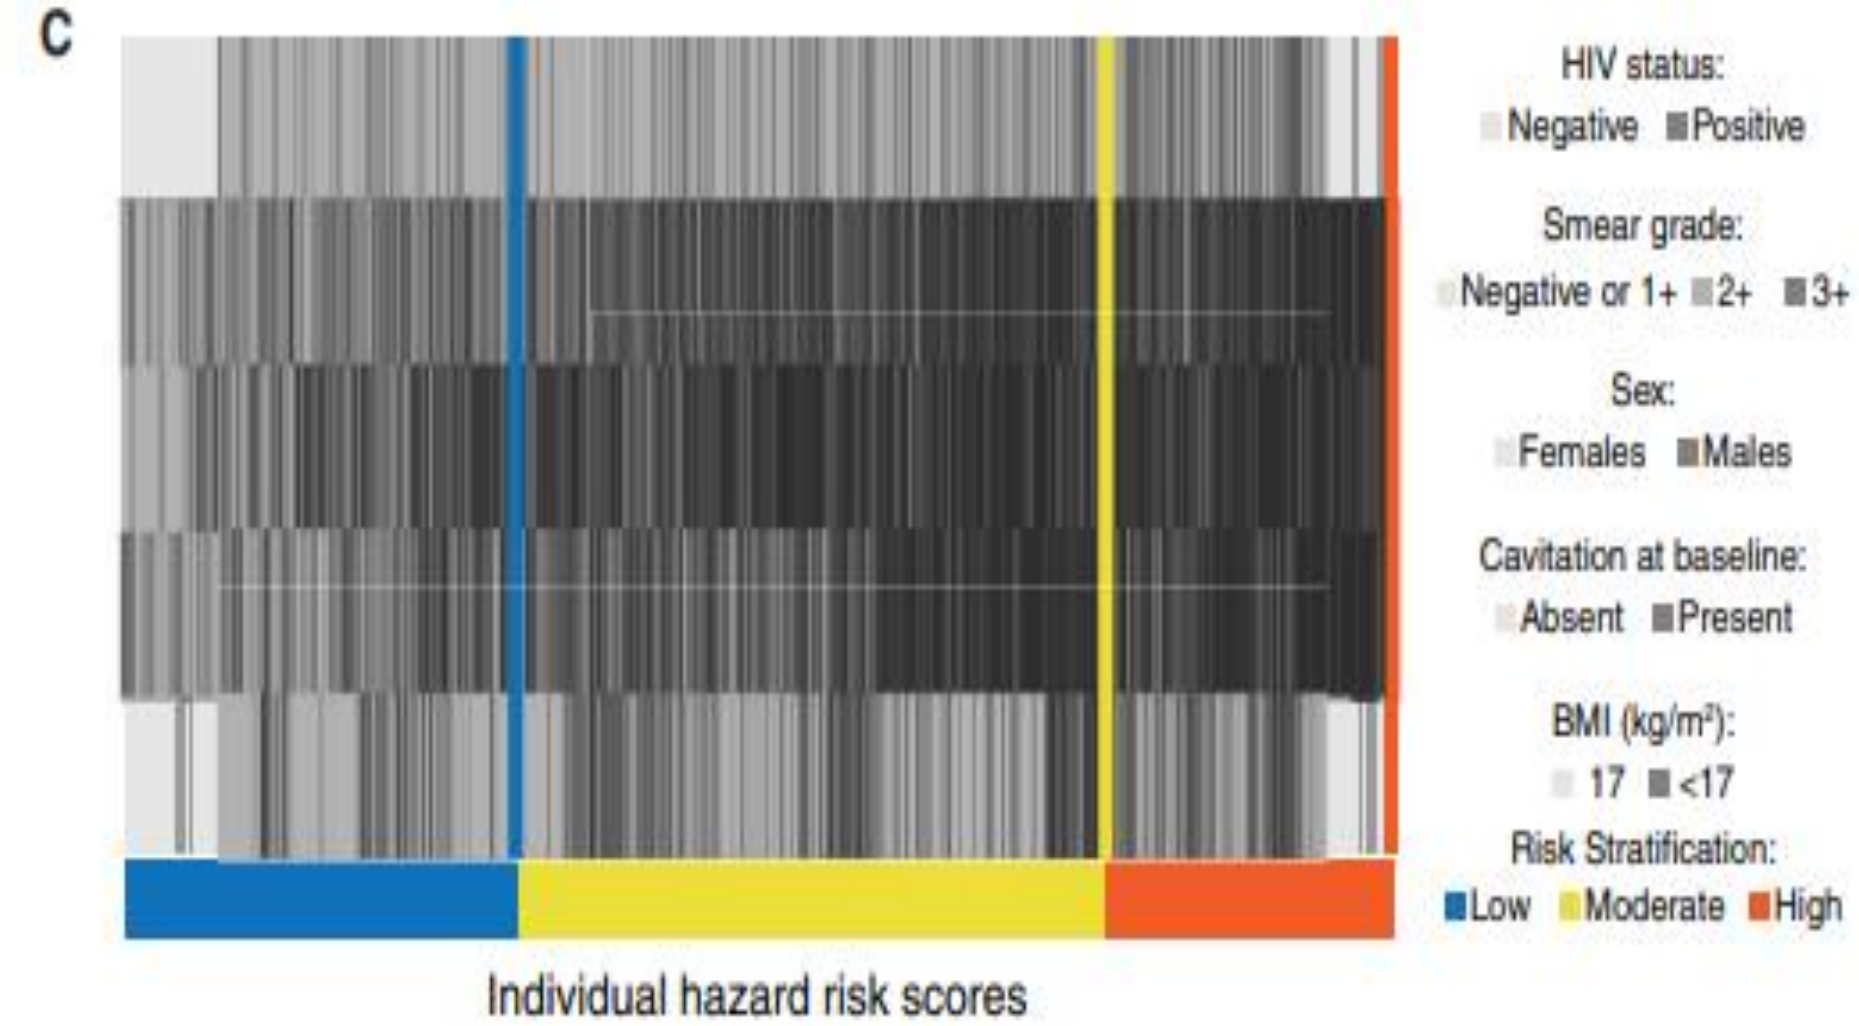

Figure 1. Distribution of individual risk scores, optimal treatment durations, and risk factors for target cure of 93% in the model development population. (*A*) Distribution of individual risk scores stratified by low-, moderate-, and high-risk groups. (*B*) Distribution of predicted optimal treatment durations for target cure rate of 93% stratified by low-, moderate-, and high-risk groups. (*C*) Heat map distribution of identified risk factors among low-, moderate-, and high-risk groups. All individuals are arranged on the *x*-axis from lowest risk score to highest risk score, and each column in each row (risk factor) represents a single individual. The low-risk group was defined as patients requiring less than or equal to 18 weeks of treatment, the moderate-risk group as requiring 19–24 weeks of treatment, and the high-risk group as requiring more than 24 weeks of treatment for a target cure rate of 93%. BMI = body mass index.

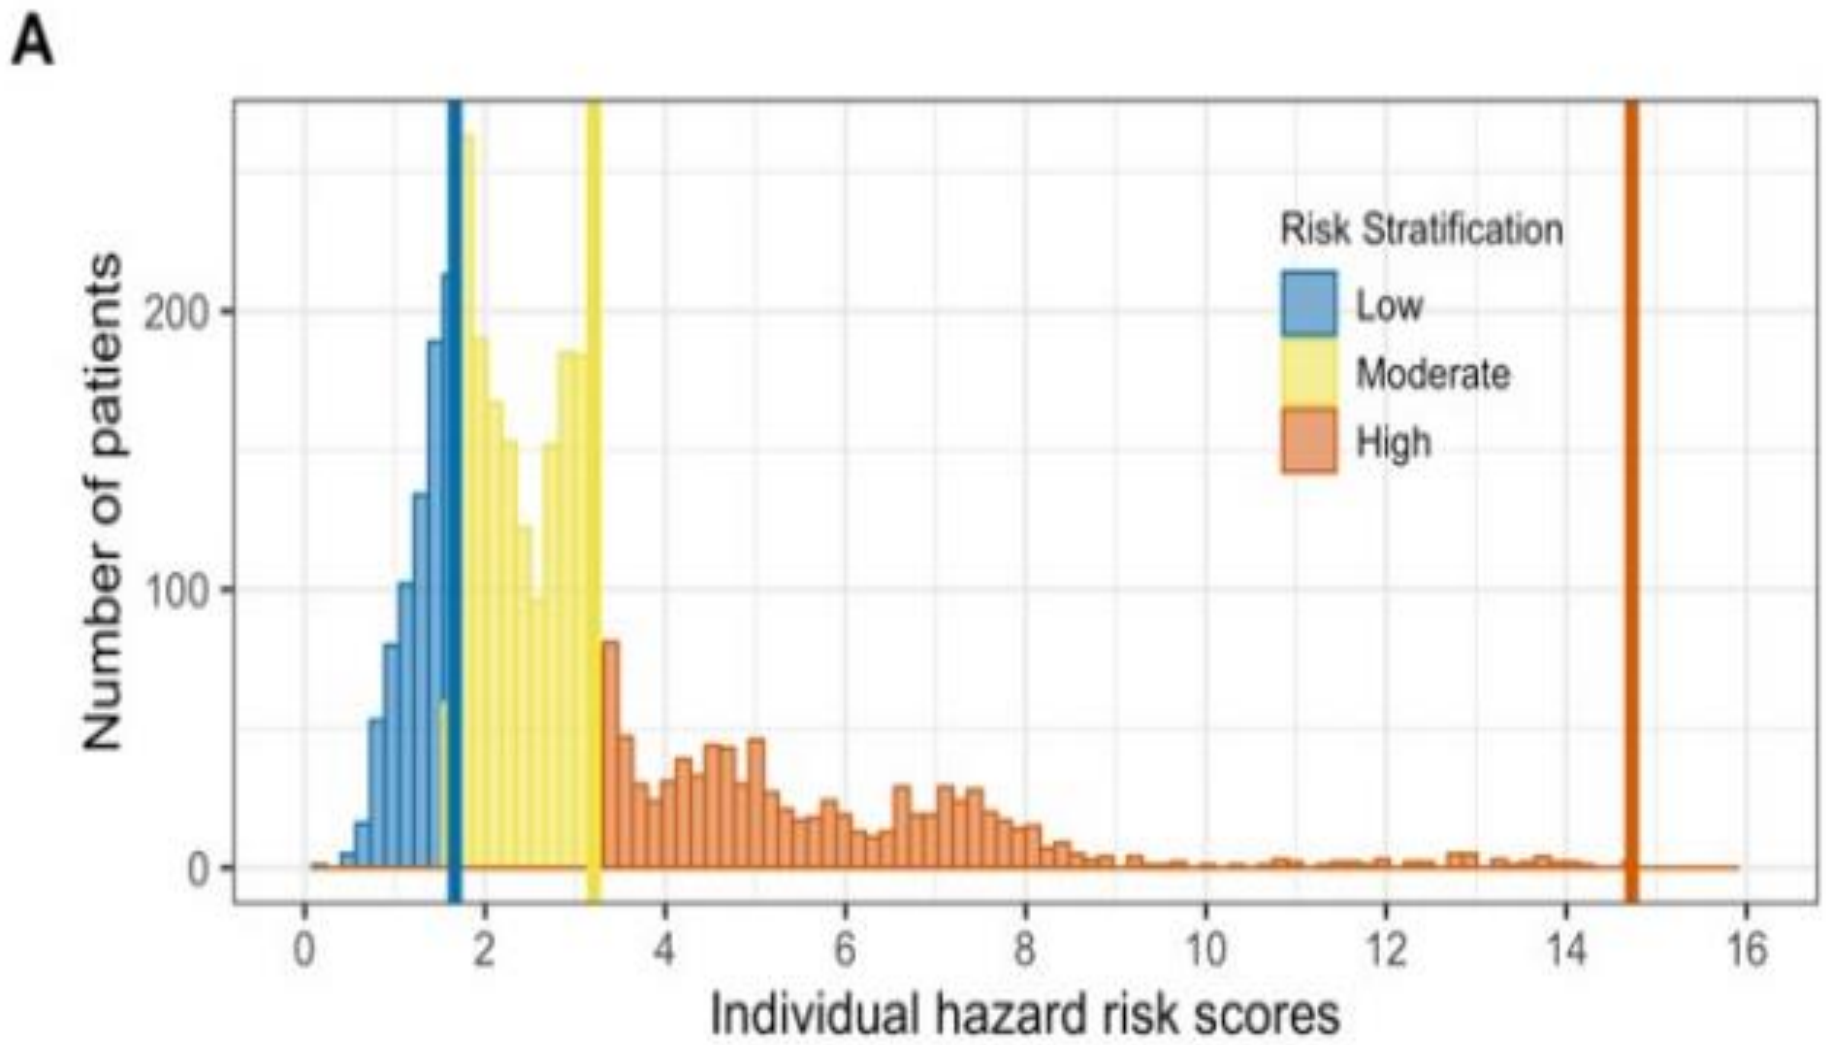
Imperial et al, Am J Resp Crit Care Medicine, Nov 2021

DISTRIBUTION OF PATIENT RISK SCORES



Imperial et al, Am J Resp Crit Care Medicine, Nov 2021

$$Risk\ Score = f_1(AUC) * f_2(Xpert) * f_3(Extent\ of\ Disease) * f_4(Age) * f_5(BMI) * f_6(Diabetes)$$

Better ---------- Worse

Stratified Medicine for TB Care (>35000 patient data base)

Bringing stratified medicine to TB – a paradigm shift in overall objectives in TB care

1. Reduce duration (and toxicity, cost, to programmes and patients)

- Treatment for severe disease may be longer, but ~70-75% of TB patients with less severe disease can be cured with shorter durations

2. Patient-centered approach

- Selecting regimen with greater precision for burden of disease

3. Enhancing cure rates for severe TB

- Achieve higher cure rates across the population, as unfavourable outcomes are dominated by severe forms of the disease.

4. Alternative to "One Size Fits All" approach in the field is feasible

- Novel diagnostics will enable simple implementation of stratified medicine

Perspective

Tuberculosis endotypes to guide stratified host-directed therapy

Andrew R. DiNardo,[1,*] Tomoki Nishiguchi,[1] Sandra L. Grimm,[2,3] Larry S. Schlesinger,[4] Edward A. Graviss,[5] Jeffrey D. Cirillo,[6] Cristian Coarfa,[2,3] Anna M. Mandalakas,[1] Jan Heyckendorf,[7,8,9] Stefan H.E. Kaufmann,[10,11,12] Christoph Lange,[7,8,9] Mihai G. Netea,[13,14] and Reinout Van Crevel[13,*]

TB Endotypes

Distinct molecular profiles, with specific metabolic, epigenetic, transcriptional, and immune phenotypes.

Characterized by either immunodeficiency or pathologic excessive inflammation.

DiNardo et al, Medicine 2, March 2021

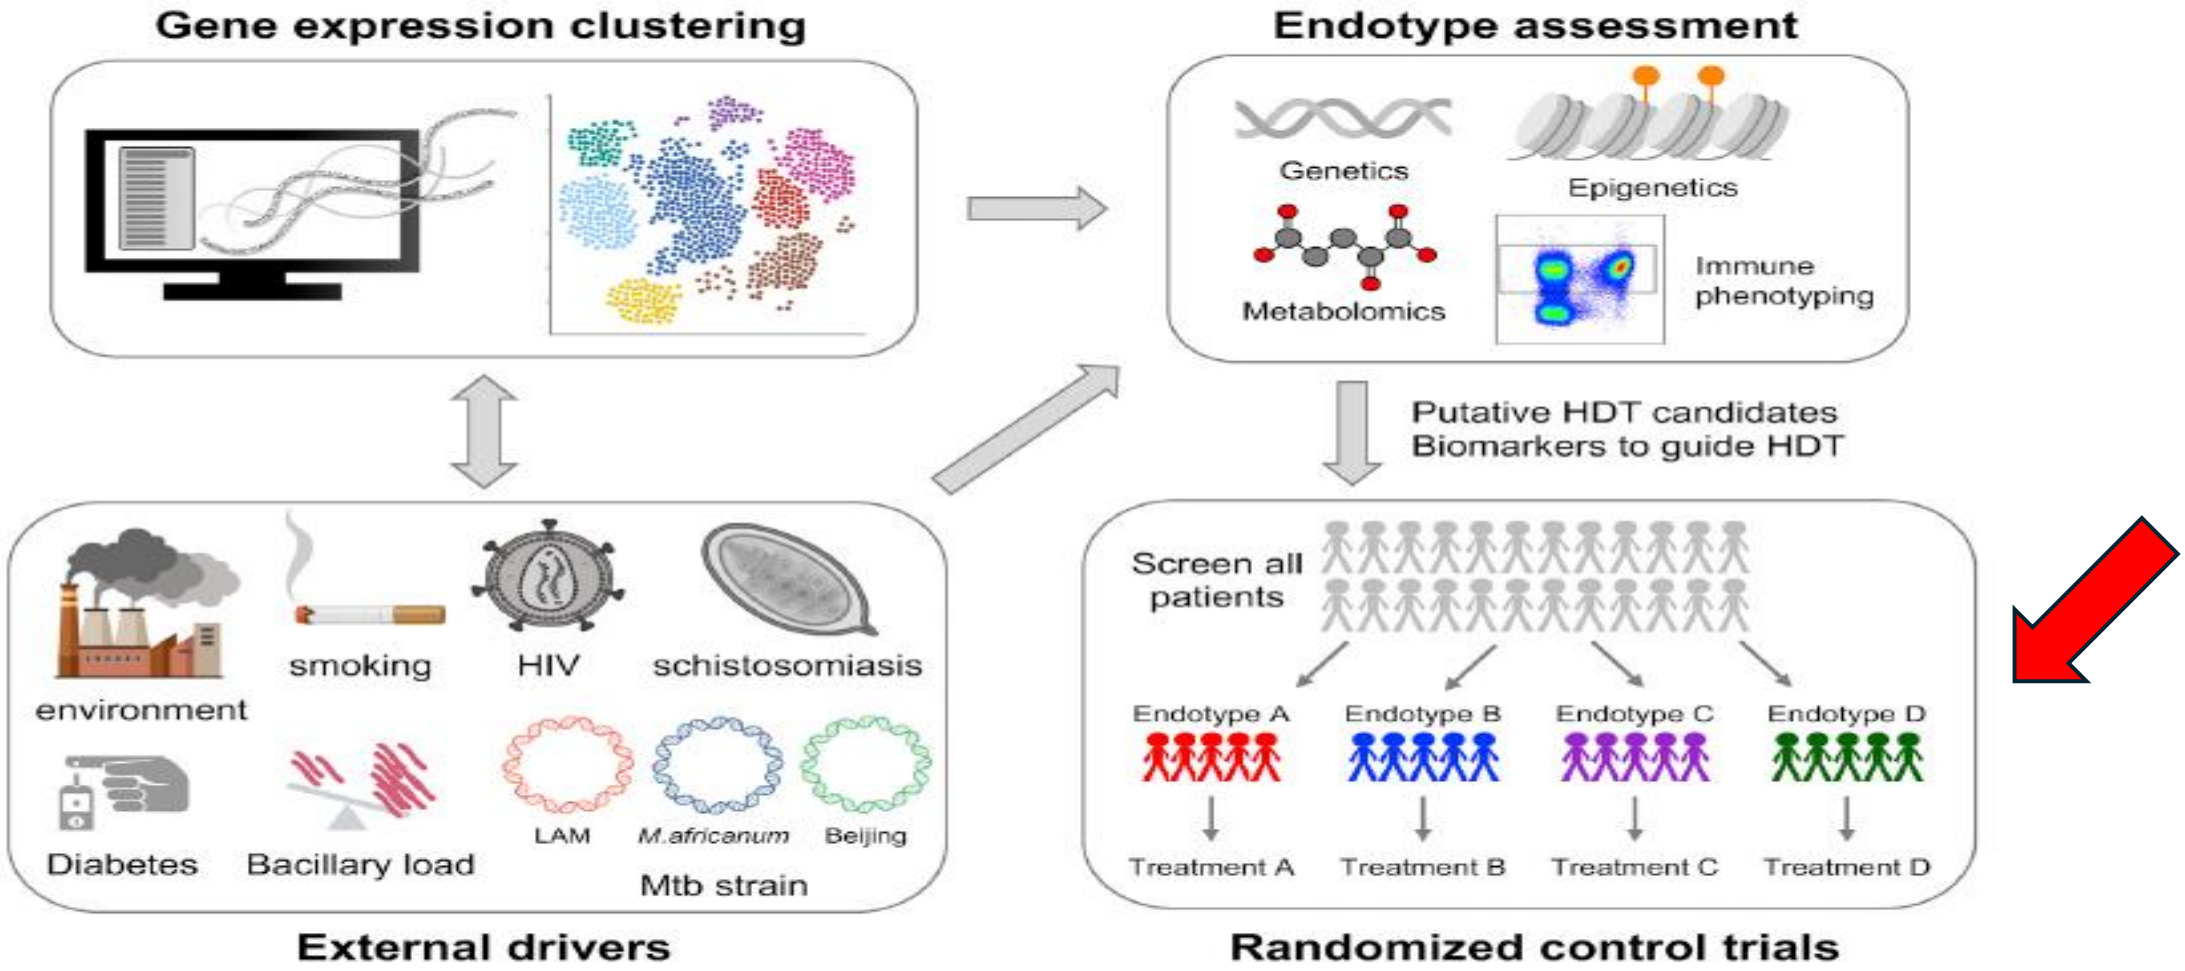

Figure 3. Unbiased clustering of publicly available data allows for identification of gene expression-derived dusters

Applying multimodal integration techniques, endotypes can be discovered and characterized on the basis of the their metabolic, epigenetic, genetic, and immune phenotype. Similarly, multimodal integration would clarify which epidemiologic factors are likely driving specific endotypes. Multimodal integration will identify the constellation of clinical epidemiology and biomarkers best suitable for treatment with putative HDT candidates that should be prospectively evaluated in umbrella and basket clinical trials.

Where should research be going? What does the TB Community Want?
